```
Peptides AAB48474-B48496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB46474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid
   Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic.
  Nootropic, neuroprotective, antifibrillogenic, amyloidosis inhibition, cytoprotection, amyloid deposit degradation, amyloidosis disorder; Alzheimer's disease.

cc other amyloid related disorders in humans. It is based on a portion of amyloid-beta peptide (see AAB82622), and may be modified by removing or inserting 1 or more amino acid residues, or by substituting 1 or more amino acid residues or non-amino acid cragments. Vaccines with other amino acid residues or non-amino acid fragments. Vaccines of the invention are produced using 'non-self' competides synthesised from the unnatural D-configuration amino acids to avoid the drawbacks of 'self' proteins. The all-D peptides need not be aggregated to be operative or immunogenic. They preferably interact with at least 1 region of an amyloid protein, e.g. the beta-sheet region or GAG-binding site region, the amyloid-beta peptide, or their immunogenic fragments, protein conjugates, immunogenic derivative peptides and immunogenic peptidemimetics. Examples include all-D peptides

CC fragments protein conjugates, immunogenic derivative peptides and immunogenic peptides and the all-D derivative peptides and 54-42 of the amyloid-beta peptide amyloid-osis, e.g. of the amyloid of beta peptide and the all-D derivative peptides given in AAB82621-64. The vaccine elicits a preferential TH-2 or TH-1 response, preventing fibrillogenesis and associated cellular toxicity. The amyloid related diseases may be localised amyloidosis, e.g. diabetes type II, cheurodegenerative diseases, e.g. bovine spongiform encephalitis, created diseases, e.g. bovine spongiform encephalitis, created diseases, scrapie, cerebral amyloid angiopathy, and chronic infection (e.g. tuberculosis) or chronic inflammation (e.g. tuberculosis) or chronic inflammation (e.g. tuberculosis) or chronic inflammation (e.g. tuberculosis) carebral ever (FMF) and systemic myloidosis found in long-term haemodialysis patients
  Preventing/treating amyloid-related disease, especially Alzheimer's disease, comprises administering antigenic all-D peptide, eg. as vaccine,

  Peptides AAB48474-B48496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid
  Preventing/treating amyloid-related disease, especially Alzheimer's disease, comprises administering antigenic all-D peptide, eg. as vaccine, which elicits production of antibodies to prevent fibrillogenesis and associated cellular toxicity.
   continuitiogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic.
  The present sequence is that of an all-D peptide suitable for use for preparing vaccines for preventing or treating Alzheimer's disease and

   The present sequence is that of an all-D peptide suitable for use for preparing vaccines for preventing or treating Alzheimer's disease and other amyloid related disorders in humans. It is based on a portion of amyloid-beta peptide (see AABS262), and may be modified by removing or inserting 1 or more amino acid residues, or by substituting 1 or more amino acid residues or non-amino acid fragments. Vaccines of the invention are produced using 'non-self' fragments vaccines of the invention are produced using 'non-self' peptides synthesised from the unnatural D-configuration amino acids to avoid the drawbacks of 'self' proteins. The all-D peptides need not be aggregated to be operative or immunogenic. They preferably interact with at least 1 region of an amyloid protein, e.g. the beta-sheet region or GAG-binding site region, the amyloid-beta peptide, or their immunogenic fragments, protein conjugates immunogenic derivative peptides and immunogenic peptidemimetics. Examples include all-D peptides and immunogenic peptidemimetics. Examples include all-D peptides and corresponding to residues 1-42, 1-40, 1-35, 1-28, 1-7, 10-16, 16-21 and corresponding to residues 1-42, 1-40, 1-35, 1-28, 1-7, 10-16, 16-21 and corresponding to residues lelicits a preferential TH-2 or TH-1 response, or AABB3623-64. The vaccine elicits a preferential TH-2 or TH-1 response, or related diseases may be localised amyloidosis, e.g. diabetes type II, cheurodegenerative disease, e.g. bovine spongiform encephalitis, created diseases scrapic, cerebral amyloid angiopathy, and prion protein related disorders, or systemic amyloidosis associated with chronic infection (e.g. tuberculosis) or chronic inflammation (e.g. tuberculosis) or chronic inflammation (e.g. tuberculosis) and every (PMF) and systemic amyloidosis found in long-term haemodialysis patients

The present invention relates to a new method of inhibiting cerebral amyloid angiopathy. The new method of the invention involves contacting a blood vessel wall cell with an amyloid-beta40 inhibitor. The invention can be used for treating disease states characterised by cerebral amyloid angiopathy, particularly Alzheimer's disease, hereditary cerebral amyloid memorrhage with mayloidosis of the Dutch type and haemorrhagic stroke. The present sequence represents one of a group of peptides (AAU11648-AAU11669, AAU11910 & AAU11911) that were used in the invention as a carrier for the amyloid-beta40 (Abeta40) inhibitor. The Abeca40 inhibitor was used in the invention to treat a disease state characterised by cerebral amyloid angiopathy (CAA)

The present invention describes compositions (C) comprising: (a) a first agent (a1) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidonimetic that modulates amyloid-beta fibril formation or induces a prophylactic or therapeutic immune response against amyloid-beta fibril formation; or (ii) an immune system modulator that prevents or inhibits amyloid-beta fibril formation. Also described is a kit comprising (C). (C) have notropic, neuroprotective, cerebroprotective, haemostatic, notropic, antichyroid, vasotropic, cardiovascular, tranquilliser, uropathic, antichyroid, vasotropic, cardiovascular, tranquilliser, uropathic, anticonvulsant, anti-HIV, antiparkinsonian, muscular, neuroleptic, cardiant, antidepressant, endocrine and hypnotic activities, and cas and can be used as amyloid-beta fibril formation modulators, and as information modulators. (C) can be used for preventing or treating an amyloid-beta related disease e.g. Alzheimer's disease (including sporadic mild-to-moderate cognitive impairment, vascular dementia, cerebral amyloid angiopathy, hereditary cerebral haemorrhage, senile dementia, degeneration, or a condition associated with Alzheimer's disease (including hypothyroidism, cerebrovascular disease, cardiovascular disease, cardiovascular disease, memory loss, anxiety, a behavioural dysfunction (e.g. apathy,

cc other amyloid related disorders in humans. It is based on a portion of amyloid-beta peptide (see AAB82622), and may be modified by removing or inserting 1 or more amino acid residues, or by substituting 1 or more amino acid residues or non-amino acid fragments. Vaccines of the invention are produced using 'non-self' cragments. Vaccines of the invention are produced using 'non-self' cavoid the drawbacks of 'self' proteins. The all-D peptides need not be aggregated to be operative or immunogenic. They preferably interact with at least 1 region of an amyloid protein, e.g. the beta-sheet region or GAG-binding site region, the amyloid-beta peptides or their immunogenic fragments, protein conjugates, immunogenic derivative peptides and immunogenic peptidomimetics. Examples include all-D peptides

CC fragments protein conjugates, immunogenic derivative peptides and immunogenic peptidomimetics. Examples include all-D peptides

CC fragments fibrillogenesis and associated cellular toxicity. The amyloid seases may be localised amyloidosis, e.g. diabetes type II, celated diseases may be localised amyloidosis, e.g. diabetes type II, celated diseases scrapie, cerebral amyloid angiopathy, and crelated diseases, e.g. bovine spongiform encephalitis, crelated diseases, e.g. bovine spongiform encephalitis, crelated diseases, e.g. bovine spongiform encephalitis, chronic infection (e.g. tuberculosis) or chronic inflammation (e.g. tuberculosis) or chronic inflammation (e.g. tuberculosis) or chronic inflammation (e.g. tuberculosis) or chronic inflammation (e.g. tuberculosis) or chronic inflammation (e.g. myloidosis patients
   Preventing/treating amyloid-related disease, especially Alzheimer's disease, comprises administering antigenic all-D peptide, eg. as vaccine,

   Peptides AAB48474-B48496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Albaimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan
   Preventing/treating amyloid-related disease, especially Alzheimer's disease, comprises administering antigenic all-D peptide, eg. as vaccine, which elicits production of antibodies to prevent fibrillogenesis and associated cellular toxicity.
  nding region and the prot-prot interaction region of the human amyloid
   Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic.
   The present sequence is that of an all-D peptide suitable for use for preparing vaccines for preventing or treating Alzheimer's disease and

The present sequence is that of an all-D peptide suitable for use in preparing vaccines for preventing or treating Alzhaimer's disease and other amyloid related disorders in humans. It is based on a portion of amyloid-beta peptide (see AAB8262), and may be modified by removing or inserting 1 or more amino acid residues, or by substituting 1 or more amino acid residues or non-amino acid residues with other amino acid residues or non-amino acid residues with cheinvention are produced using 'non-self' regeners. Vaccines of the invention are produced using 'non-self' cayold the drawbacks of 'self' proteins. The all-D peptides need not be aggregated to be operative or immunogenic. They preferably interact with at least 1 region of an amyloid protein, e.g. the beta-sheet region or aggregated to of an amyloid protein, e.g. the beta-sheet region or fragments, protein conjugates, immunogenic derivative peptides and immunogenic peptidommetics. Examples include all-D peptides

corresponding to residues 1-42, 1-40, 1-35, 1-28, 1-7, 10-16, 16-21 and immunogenic peptide and the all-D derivative peptides given in AAB82622-64. The vaccine elicits a preferential TH-2 or TH-1 response,
  preventing fibrillogenesis and associated cellular toxicity. The amyloid related diseases may be localised amyloidosis, e.g. diabetes type II, neurodegenerative diseases, e.g. bovine spongiform encephalitis, creutzfeldt-Jakob disease, scrapis, cerebral amyloid angiopathy, and prion protein related disorders, or systemic amyloidosis associated with chematoid archritis), familial Mediterranean fever (FMF) and systemic amyloidosis found in long-term haemodialysis patients
which elicits production of antibodies to prevent fibrillogenesis and

invention

The invention relates to a method for prevention and/or treatment of an amyloid-related disease which comprises administration of an all-D - amyloid-related disease which comprises administration of an all-D - amyloid-beta peptide. The method is used for preventing and/or treating his content and other amyloid related disease e.g. cerebral amyloid angiopathy; for altering serum levels of amyloid-beta in a mammal and caround and reducing or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid diseases including carburitis, ankylosing spondylitis, psorials, juvenile chronic arthritis, ankylosing spondylitis, psorials, psoriatic arthropathy, Reiter's syndrome, Adult Still's disease, Bechet's syndrome and Crohn's disease. AA deposits are also produced as a result of chronic microbial infections (preferably leprosy, tuberculosis, bronchiectsais, descubitus cucers, chronic pyelonephritis, otherwise and Whipple's disease.

Certain malignant neoplasms can also result in AA fibril amyloid deposits including Hodgkin's lymphoma, renal carcinomas of gut, lung and urogenital tract, basal cell carcinoma, carcinomas of gut, lung cand urogenital tract, basal cell carcinoma, carcinomas of gut, the present sequence is an Abeta peptide used to illustrate the method of the

   and polypeptides. Also disclosed are vectors, expression cassettes, host cells, and plants containing such polynucleotides. Also disclosed are methods for using the polynucleotides and polypeptides to alter the responsiveness of a plant to ablotic stress. The invention is useful in agriculture. The mucleic acid is useful for determining whether a test plant has been exposed to an ablotic stress condition. It is also useful for selecting an agent that alters ablotic stress regulated polynucleotide expression in a plant cell, and to identify a homolog or ortholog to an abiotic stress responsive polynucleotide. The nucleic acid molecule and the polypeptide encoded by it are useful in altering the responsiveness of a plant to an abiotic stress, such as cold stress, salt stress, osmotic stress or any of their combinations. The present sequence is used in the exemplification of the invention
   New stress-responsive nucleic acid, useful for altering the responsiveness of a plant, e.g. cereal, to an abiotic stress such as cold stress, salt stress or osmotic stress.

nucleotide sequence selected from one of 1680 sequences, a mature protein coding portion of them, an active domain of them and their complementary sequences. The invention may be useful for the production of compounds with an antiarthritic, antiparshinsonian, neuroprotective, nootropic, immunosuppressive, cytostatic, antipsoriatic, antiparastic activity. In addition, the disclosed sequences may be useful for gene therapy. The polypeptides or their antibodies are useful for treating many diseases such as arthritis, Parkinson's, Alzheimer's, autoimmune diseases, cancer, psoriasis, inflammatory bowel disease and infections caused by bacteria, viruses, fungi or parasites. The present sequence is that of a human polypeptide of the invention.

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polymodicide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant baving an improved property. The plant is a crop plant cutch and growing the transformed plant with the combinant DNA construct and growing the transformed plant where the polymucleotide or polypeptide is useful for improving plants with the compinant DNA construct is useful for improving plants with construct is useful for improving plants with construct to polymucleotides, extreme commoint conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the content, improved plant disease, better growth rate by modification of the content, improved plant growth and development under at least one stress condition, improved light plant growth and development under at least one stress condition, improved light production of improved algain production of improved algain production of improved algain production of improved algain production of improved light in production of improved in the sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence date for this patent did not form part of the printed specification but was obtained in electronic form transformed transformed plant growthened sequence. The sequence child is not form part of the printed specification but was obtained in electronic form part of the printed specification but was obtained in electronic constitution.

This sequence represents a Borrelia burgdorferi (Bb) protein of the invention, which is suitable for use in a vaccine. The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members of the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for detection of members of the Borrelia genus

   This invention relates to a novel method for targeting disruption of an arbitrary gene in a genome of an organism which comprises providing the whole sequential date of the genome of such organism, selecting at least 1 arbitrary region in the sequence, providing a vector that contains a sequence homologous with the selected region and a marker gene, transformation, and homologous recombination. The genome is preferably the genome of a hyperthermostable archaebacterium, particularly the genome of a hyperthermostable archaebacterium, particularly the genome of a gene in the genome of an organism, which is applicable in studying gene structure and functions as well as enzyme activities of encoded proteins and useful in medicine, forenaic science, food or drug inspection, molecular biology and immunology. With this method, the choose of gene at an arbitrary position in a genome can be achieved efficiently and reliably. The present sequence is that of a protein encoded by the genome of Thermococcus kodakaraensis which was derived can electronic form part of the printed specification, but was obtained in electronic format directly from WIPO at the present sequence is the print this method, the present did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the print will be a protein the wipo.int/pub/published_pct_sequences

   Arabidopsis fatty acid elongation enzyme FAEI (AAR95594) catalyses the conversion of olsic acid (18:1) to eicosenoic acid (20:1) and of eicosenoic acid to erucic acid (22:1). Its amino acid sequence was deduced from that of a clone (AAY27036) isolated from a cDNA library prepd. from Arabidopsis green siliques. Expression of the FAEI enzyme in transgenic plants, e.g. Brassica napus, can be used to modulate the fatty acid content of the plant, partic. the seed oil. Use of antisense DNA constructs suppresses the native FAEI gene, allowing prodn. of edible sense bNA constructs allows prodn. of oils with raduced content of very long chain fatty acids (VLCFA). Use of sense DNA constructs allows prodn. of oils with raised VLCFA content for industrial use. (Updated on 16-OCT-2003 to standardsee OS field)
  New DNA constructs contg. FAEI gene sequences - used to produce transgenic plants with modified fatty acid content in plant organs or parts, esp. seeds.

   The invention relates to fatty acid elongase 3-ketoacyl CoA synthase (KCS) polypeptides with altered substrate specificity and/or catalytic activity and nucleic acid molecules encoding such polypeptides. Polypeptides of the invention are useful for catalysing the condensation of C18 fatty acyl substrate and malonyl CoA, leading to the synthesis of C20 fatty acyl substrate and malonyl coA, leading to the synthesis of chain fatty acyl CoA. They are especially useful for producing very long chain fatty acids (VLCFA) and may be used in the development of reagents for various purposes, e.g., immunological reagents to monitor expression of elongase KCS polypeptides or nucleic acid probes or primers to monitor inheritance of an elongase KCS gene in plant breeding programs. The present sequence is an alternative version of Arabidopsis thaliana FABI-Brassica napus elongase KCS chimeric procein designated as At399. (Updated on 29-AUG-2003 to standardise OS field)

Polypeptides of the invention are useful for catalysing the condensation of C18 fatty acyl substrate and malonyl CoA, leading to the synthesis of C20 fatty acyl CoA. They are especially useful for producing very long cath and fatty acyl CoA. They are especially useful for producing very long for various purposes, e.g., immunological reagents to monitor expression of elongase KCS polypeptides or nucleic acid probes or primers to monitor inheritance of an elongase KCS gene in plant breeding programs. The present sequence is Brassica napus elongase KCS- Arabidopsis chaliana FABI chimeric protein designated as Bn176. (Updated on 29-AUG-2003 to standardise OS field) The invention relates to fatty acid elongase 3-ketoacyl CoA synthase (KCS) polypeptides with altered substrate specificity and/or catalytic activity and nucleic acid molecules encoding such polypeptides.

Polypeptides of the invention are useful for catalysing the condensation of C18 fatty acyl Substrate and malonyl CoA, leading to the synthesis of C20 fatty acyl COA. They are especially useful for producing very long chain fatty acids (VLCRA) and may be used in the development of reagents for various purposes, e.g., immunological reagents to monitor expression of elongase KCS polypeptides or nucleic acid probes or primers to monitor inheritance of an elongase KCS gene in plant breeding programs. The present sequence is Arabidopsis thaliana elongase KCS protein encoded by New fatty acid elongase 3-ketoacyl CoA synthase polypeptide and nucleic acids encoding the polypeptide, useful for producing very long chain Gaps Fatty acid elongase 3-ketoacyl CoA synthase; elongase KCS; enzyme; very long chain fatty acid; VLCFA; FAE1 protein. ö Score 28; DB 5; Length 506; Pred. The invention relates to an expression vector for transforming a cell.

The expression vector comprises a gene coding for a plant fatty acid elongase (REA, also designated 3-ketoacyl-coA synthase (RCS) in reading clongase (REA, also designated 3-ketoacyl-coA synthase (RCS) in reading the proportion of very long chain monounsaturated fatty acid when compared with a control cell. Also described are: (1) a cell comprising a heterologous gene coding for a heterologous plant fatty acid dhompase or its allelic variant, the cell being capable of producing an increase in proportion of a very long chain monounsaturated fatty acid when compared control cell lacking the heterologous gene; (2) a seed comprising the plant cells above; (3) a plant comprising the plant cells; and (4) a method of altering erucic acid content of a plant cells; and (4) a method of altering erucic acid content of a plant seed cell.

The plant cell additionally comprises is a Nasturtium, Crambe, or Arabidopsis fatty acid elongase gene. The cell is a fungal cell.

The plant cell additionally comprises a further heterologous gene coding for an additional heterologous plant fatty acid elongase or its allelic variant or a heterologous plant fatty acid elongase or its allelic variant or cher very long chain fatty acid (C20 or greater). The heterologous gene codes gene codes for a 3-ketoacyl-coA synthase. The very long chain fatty acid (C20 or greater). The heterologous plant fatty acid elongase erucic acid. The heterologous functional the plant cell is a fungal cell in the set of content of erucic acid content of erucic acid content of erucic acid content and alterional and comprises erucic acid. The heterologous plant fatty acid (C20 or greater). The heterologous plant fatty acid (C20 or greater) the heterologous plant fatty acid (C20 or greater). The heterologous plant fatty acid (C20 or greater) the plant cell in the fatty acid (C20 or greater) the heterologous plant fatty acid elongase or its allelic and plant fatty acid elongase or its allelic and

   This sequence represents a Borrelia burgdorferi (Bb) protein of the invention, which is suitable for use in a vaccine. The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members of the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for detection of members of the Borrelia genus

   New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
  The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant cransformed plant having an improved property. The plant is a crop plant transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polymucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with

   New recombinant DNA construct, useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for conferring increased resistance to plant disease, or for improving yield.
   The invention describes a recombinant DNA construct comprising a polymucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at ftp.seqdata.uspto.gov/sequence.html?DocID:2004034888. The polymucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme

The invention relates to novel genes (AAL34669-AAL37666) and proteins (ABB03087-ABB04109) associated with the musculoskeletal system useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (anh) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, adrenal gland, bone, bone marrow, breast, astrointestinal tract, liver, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid authoritis and ulcerative colitis, (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
  Isolated polypeptide for treating, preventing and/ or prognosing disorders related to the musculoskeletal system including musculoskeletal cancers and also for testing and detection e.g. diagnosis.

The invention describes an isolated mucleic acid molecule comprising a sequence encoding musculoskeletal system associated polypeptides useful condence metabolism, and a sequence encoding musculoskeletal system associated polypeptides useful for detecting disorders, e.g., cancer or cancer metabases, in animals or humans. The nucleic acid: stimulates revacularisation of ischaemic tissues associated with conditions; treats wounds due to injuries, and other cardiovascular conditions; treats wounds due to injuries, cand other cardiovascular conditions; treats wounds due to injuries, and limb regeneration; stimulates neuronal growth; can treat and prevent conditions, such as, Alzheimer's disease, Parkinson's disease, and AlDS-conditions, such as, Alzheimer's disease, Parkinson's disease, and ALDS-conditions, such as, Alzheimer's disease, Parkinson's disease, and ALDS-conditions, such as, Alzheimer's disease, Parkinson's disease, to conditions, such as, Alzheimer's disease, Parkinson's disease, to be conditions, such as, Alzheimer's unburn by stimulating comparation or bene grafts; prevents skin aging due to sunburn by stimulating certain and promptes melancyte growth; stimulates activate hair-forming cells and promptes melancy activate hair-forming cells and promptes melancyte growth; stimulates creases the differentiation of hematopoietic cells and bone marrow cells increase or decreases the differentiation or proliferation of embryonic concents such as, body height, weight, hair colour, eye colour, extendence or physical state by influencing blorhythms, carloadic rhythms, comments increases or decreases the differentiation or proliferation or expenditive comments or physical state by influencing blorhythms, carloadic rhyms, comments increases or decreases storage capabilities, feater or physical state by influencing blorhythms, carbohydrate, vitamins, minerals, concent, cappointer, libia is decreases storage capabilities, decreases or decreases storage capabilities, or or one concerned concents. Comments or or or 
   musculoskeletal system antigen. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the US patent office at ftp.seqdata.uspto.gov/sequence.html?DocID=20020147140

The invention relates to a novel isolated musculoskeletal system-associated nucleic acid molecule. The nucleic acid of the invention demonstrates cyrostatic and osteopathic activities and may be useful for preparing a medicament for preventing, treating or ameliorating a medical condition such as cancer of the musculoskeletal tissues or osteopozosis, possibly via gene therapy or vaccine production. The current sequence is that of the human musculoskeletal system-associated polypeptide of the invention. The current sequence is not shown within the specification per se but is available on the USPTO web-site
   New nucleic acid molecule, useful for preparing a medicament for preventing, treating or ameliorating a medical condition e.g., cancer of musculoskeletal tissues or osteoporosis.

  The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can threfore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
  New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures.

;
   The invention relates to the field of plaque amyloid deposits that are the hallmarks of Alzheimer's disease. In particular, the invention relates to an isolated, functionally-active protein that has gamma-secretase activity. Gamma-secretase activity is necessary for amyloid production. The present invention also relates to methods for isolating integral-membrane proteins and protein complexes, including the gamma-secretase protein of the invention. The method is useful for monitoring the cleavage of beta-amyloid precursor protein (betaAPP) by gamma-secretase. The present sequence is human recombinant betaAPP protein (C-
production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polynetides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesia regulating activity, tissue growth factor activity, immnomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or recament of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

  The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to traat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, foremsics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and anno acid sequences. Asgonono-Asganant restence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from MIPO at (II) was obtained in electronic format directly from MIPO at (II).

Sequences AAU27676-AAU28019 represent full-length polypeptides and contig polypeptides of the invention. The proteins and their associated DNA sequences are useful for the treatment, diagnosts and prevention of various types of disorder in a mammalian subject such as a human, dog, monkey, mouse, hamster or rat. The disorders include cancers such as cell-entantia, lymphoma and neuroblastcoma, autoimmune disorders such as multiple sclerosis, connective tissue disease, rheumatoid arthritis, disorders mellitus, allergic rhinitis, asthma and eczema, nervous system clasorders such as Parkinson's disorders such as parkinson's disorders such as parkinson's disorders under arrophy and chorea, amyotrophic lateral sclerosis, spinal muscular atrophy and chorea, amyotrophic lateral sclerosis, spinal muscular atrophy and disease, inclhammatory disorders such as nephritis, Crohn's chorea, inflammatory disorders such as nephritis, Crohn's coll sease. The sequences exhibit activity relating to angiogenesis, cell proliferation, cell differentiation, stem cell growth factor, cell proliferation, cell differentiation, stem cell growth factor, activin or inhibin. Therefore, they can be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, accidental damage or genetic disorders. The sequences may also be used for regeneration of bone, cartilage, tendons and ligaments and in tissue repair and burn healing. Note: Some sequences for this patent did not form part of the printed especial captained in electronic format directly from MIPO

This invention relates to novel mitochondrial targets that can be used for therapeutic intervention in treating a disease associated with altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, osteoarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial concephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRP) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic, anticonvalsant, antiarthritic, osteopathic, ophthalmological and cycostatic activities. This polypeptide sequence is a human heart
   Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
  Identifying a mitochondrial target for drug screening assays and for treating diseases associated with altered mitochondrial function, comprises detecting a modified polypeptide in a sample and correlating with the disease.

```
The invention relates to an isolated or purified nucleotide sequences (I) from Legionella pneumophila Paris strain. (I), and their related sequences or fragments, are useful as primers and probes for detection and amplification, including differentiation between the Paris and Philadelphia strains of Legionella pneumophila and to prepare recombinant (hybrid) polypeptides (II). (II) are also useful for preparation of specific antibodies (Ab), also used for detection/identification of Legionella, and some (I), specifically those involved in synthesis of surface proteins, are targets for identification of inhibitors. (II), or vectors that contain (I), are useful as vaccines and immunogenic compositions, for treatment and prevention of infections by L. pneumophila. The present squence represents the amino acid sequence of a L. pneumophila protein.
  The invention relates to a method for quantitative immunoassay of a membrane-bound matrix metalloprotease (MT-MMP), involving using an antibody against MT-MMP selected from groups containing MT-MMPs. The method involves releasing and/or solubilising MT-MMP from a cell membrane
   Human membrane-bound matrix metalloprotease 1 (MT1-MMP) related protein.
   Membrane-bound matrix metalloprotease; MT-MMP; MT1-MMP; enzyme; human; cancer; metastasis; rheumatoid arthritis; Alzheimer's disease; cytostatic; antiallergic; nootropic; neuroprotective.
   Immunoassay method for membrane-bound matrix metalloprotease with quantitation using its antibody, applicable in diagnosis of cancer and cancer metastasis, and in drug development.
                              New genome of Legionella pneumophila Paris strain and derived polypeptides, useful for detection or identification of the strain and for treatment and prevention of infections.

  The invention relates to a method for quantitative immunoassay of a membrane-bound matrix metalloprotease (MT-MMP), involving using an antibody agalinst MT-MMPs. The mattbody agalinst MT-MMPs. The method involves releasing and/or solubilising MT-MMP from a cell membrane among a group of MT-MMPs by using a surfactant and reductant. Such a method is for detecting a membrane-bound matrix metalloprotease with quantitation, which is applicable in diagnosis of cancer and cancer metastasis as well as in drug development, and is also used to monitor progress of rheumatoid arthritis and Alzheimer's disease. This sequence represents a rat MTI-MMP related protein
among a group of MT-MMPs by using a surfactant and reductant. Such a method is for detecting a membrane-bound matrix metalloprotease with quantitation, which is applicable in diagnosis of cancer and cancer metastasis as well as in drug development, and is also used to monitor progress of rheumatoid arthritis and Alzheimer's disease. This sequence represents a human WTI-MMP related protein

A library of DNA fragments of Escherichia coli strains for the phylogenic determination of a given strain comprises polynucleotides of nature B2/D +
   barley (Hordenn vulgare) which contain single nucleotide polymorphisms (SNP). The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an oligonucleotide clone sequence featured in the specification. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
  invention relates to oligonucleotide clones originating in
  immunosuppressive; extra-intestinal infection; phylogeny; meningitis; systemic infection; non-diarrhoeal infection; septicaemia; pyelonephritis; antibiotic resistance.
   Single nucleotide polymorphism sites in barley varieties and DNA sequences containing them for analysis and identification of barley varieties and production of barley transformants with desired

            strains comprising polymucleotides (ABA88577-ABA88729 and ABA89533) and encoded proteins (ABB52459-ABB52919 and ABB52954-ABB53994) of nature B2/D4A-. The polymucleotides have potential antiinflammatory, antibacterial and immunosuppressive activity as part of pharmaceutical compositions used to treat, pallate or prevent extra-intestinal E colinfections. The polymeptides are useful for determining the phylogenic group of a given E. coli strain. These polypeptides can detect and treat an undesired development of E. coli, particularly an extra-intestinal infection that include systemic and non-diarrhoeal infections such as septicaemia, pyelonephritis and meningitis this is particularly advantageous as bacterial resistance is increasing with the more frequent
   The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging
  invention relates to a library of DNA fragments of Escherichia coli

ö
encoding a nitrite reductase of SEQ ID NO. 11926. Further disclosed is a recombinant DNA construct for expression of a nitrite reductase gene in a plant cell, and a plant cell comprising the recombinant DNA construct. The nucleic acid is useful for determining gene expression, identifying mutations in a gene of interest, and for constructing mutations in a gene of interest. Sequences given in records for SEQ IDS 9692-16825 represent a group of 7134 Myococcus xanthus proteins and peptides. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO
   ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP95124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to ocreen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site
   epidermidis; open reading frame; ORF; bacterial infection;
  Novel isolated nucleic acid encoding a Staphylococcus epidermis polypeptide, useful for diagnosing and treating bacterial infections.

The invention describes an isolated mucleic acid comprising a nucleotide sequence with any of 3772 fully defined nucleotide sequences (SEQ ID NO: 1-3772) and enrociding an Staphylococcus epidermidis polypeptide with any of 3772-7544) as given in the specification. Also described are: a recombinant expression vector; a cell comprising a recombinant expression vector of (1); producing an S. epidermidis polypeptide; an isolated nucleic acid comprising a nucleotide sequence of at least 8 nucleotides in length; a vaccine composition for prevention or treatment of an S. epidermidis for infection, comprising a nucleic acid cited above and a carrier; treating a subject for S. epidermidis infection; a subject for S. epidermidis infection; a subject for S. epidermidis polypeptide or its fragment; a cubject for S. epidermidis polypeptide or its fragment; a vaccine composition for prevention or treatment of an S. epidermidis infection; detecting the presence of a Staphylococcus nucleic acid in a sample; a computer readable medium having recorded in it the nucleotide sample; a computer readable medium having recorded in it the nucleotide sample; a computer readable medium having recorded in it the nucleotide sequences with SQD IDN 0: 1-3772 or its fragments; a computer based system for identifying fragments of the Staphylococcus genome of commercially important nucleic acid fragments of the Staphylococcus genome and/or plasmids; and identifying an expression modulating fragment of the Staphylococcus genome and/or plasmids; and identifying an expression modulating fragment of the Staphylococcus genome and/or plasmids. The methods and compositions of the present invention are useful for the diagnosis, the present invention acid sequence of a S. epidermidis bacterial of the present invention acid sequence of a S. epidermidis bacterial of the present invention acid sequence of a S. epidermidis protein of
   antibacterial; vaccine; antisense therapy; Staphylococcus epidermidis; recombinant expression vector; infection; computer readable medium;
  New isolated polypeptide and encoding nucleic acid derived from Staphylococcus epidermidis, useful for diagnosing, preventing and/or treating an S. epidermidis bacterial infection.

The invention relates to an isolated caspase recruitment domain (CARD) -

containing polypeptide, or a CARD, NB-ARC, ANGIO-R, LRR or SAM domain

from it, and the polymucleotides encoding them. Also included are a

recombinant vector comprising the polymucleotide, recombinant cells

containing the vector (e.g. bacteria, yeast, plant, animal, mammalian and

insect cells) and an anti-CARD antibody. The CARD-containing polypeptide

and CARD-encoding nucleic acid are useful for treating a pathology

characterised by abnormal cell proliferation (e.g. cancer), abnormal cell

characterised by abnormal cell proliferation (e.g. cancer), abnormal cell

death (apoptosis), autoimmune diseases or inflammation. In particular,

the polypeptide and nucleic acid are useful for treating keratinocyte

the polypeptide and nucleic acid are useful for treating keratinocyte

typeptide and nucleic acid are useful for treating keratinocyte

typeptide and nucleic animal inflammation. In particular,

containing polypeptide and nucleic as an enable of alleages,

arthritis, lupus, Schrogen's syndrome, Crohn's disease, alleages,

disease, stroke, myocardial infarction, heart failure, neurodegenerative

chisease (e.g. Parkinson's disease or Alzheimer's disease)

cimmunodeficiency associated disease or Alzheimer's disease)

(HIV) infection). The nucleic acids are useful in a variety of dispnostic

applications. The present sequence is a CARD domain containing protein

The invention relates to a novel isolated nucleic acid encoding a Monarch -1, CATERPILIER (CARD [caspase recruitment domain], transcription enhancer, R (purine) -binding, pyrin, lots of leucine repeats) 11.2, CATERPILIER 11.3, CATERPILIER 16.1, CATERPILIER 16.2 or CIASI (coldiduced autoinflammatory syndrome 1) polypeptide comprising the amino acids encoded by exon 6 and lacking the amino acids encoded by exon 6 and lacking the amino acids encoded by exon 6 and invention demonstrates antiinflammatory and cytostatic activities and may be useful in preparing antiinflammatory and cytostatic activities and may be useful in preparing via gene therapy. The current sequence is that of a human CATERPILLER nucleotide binding domain (NBD) protein of the invention.
   New nucleic acid encoding Monarch-1, CATERPILLER 11.2, CATERPILLER 11.3, CATERPILLAR 16.1, CATERPILLER 16.2 or CIASI polypeptide, useful in preparing a composition for treating inflammatory disease or cancer.

   The invention Fracter of all solutions of the invention fractach of a biochemical containing polypeptide, or its CARN) MB-ARC, ANGIO-R, leucine rich repeat (LRR) or S-adenosyl methionine (SAM) domain, and its associated of a biochemical polypeptide. The DNA is useful for altering the level of a biochemical process (including apoptosis, NR-bapaB induction, cytokine processing, coun N-terminal kinase induction, caspase-mediated proteolysis, canscription, inflammation and cell adhesion) modulated by the DNA. The sequences are useful for treating a pathology characterised by abnormal cell proliferation, abnormal cell death or inflammation. The treatable cell proliferation, abnormal cell death or inflammation. The treatable coll proliferation in arterials following angioplasty, restenosis, benign prostatic hypertrophy, inflammatory hyperplasia, fibrosis, smooth wascle cell proliferation in arterials following angioplasty, restenosis, attoimmune diseases including allergies, inflammatory diseases including allergies, inflammatory diseases including arthritis, lupus, Sjogren's syndrome, Crohn's disease, ulcerative colitis, allograft rejection such as graft versus host diseases such as practicency associated diseases such as human immunodeficiency virus (HIV) infection. Sequences ABUGIT14-ABUGIT35 represent human CARD-containing polypeptides
  Human; caspase recruitment domain-containing polypeptide; CARD; NB-ARC; ANGIO-R; leucine rich repeat; LRR; S-adenosyl methionine domain; apoptosis; NF-kappaB induction; cytokine processing; SAM; transcription; cJun N-terminal kinase induction; caspase-mediated proteolysis; cancer; inflammation; cell adhesion; cell proliferation; abnormal cell death; keratinocyte hyperplasia; neoplasia; benign prostatic hypertroph; lupus; inflammatory hyperplasia; fiborais; amooth muscle cell proliferation; angioplasty; artery; keloid; restenosis; autoimmune disease; allergy; arthritis; Siggren's syndrome; Crohn's disease; ulcerative colitis; allograft rejection; graft versus host disease; myocardial infarction; heart failure; neurodegenerative disease; stroke; HIV.
  New caspase recruitment domain (CARD)-containing polypeptides and encoding nucleic acids, useful for treating abnormal cell proliferation or cell death, autoimmune diseases or inflammation, e.g. carcinomas,
  The invention relates to an isolated caspase recruitment domain (CARD)-

```
Peptides AAB48474-B48496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of ABA848474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alateimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid
  Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide. its isomer or peptidomimetic.
  Nootropic; neuroprotective; antifibrillogenic; amyloidosis inhibition; cytoprotection; amyloid deposit degradation; amyloidosis disorder; Alzheimer's disease.
cytoprotection; amyloid deposit degradation; amyloidosis disorder; Alzheimer's disease.

The present sequence is that of an all-D peptide suitable for use in preparing vaccines for preventing or treating Alzheimer's disease and cother amyloid related disorders in humans. It is based on a portion of amyloid-beta peptide (see AABS622), and may be modified by removing or inserting 1 or more amino acid residues, or by substituting 1 or more amino acid residues or non-amino acid fragments. Vaccines of the invention are produced using 'non-self' fragments. Vaccines of self' proteins. The all-D peptides need not be aggregated to be operative or immunogenic. They preferably interact with at least 1 region of an amyloid protein, e.g. the beta-sheet region or a least 1 region of an amyloid beta peptides need not be aggregated to be operative or immunogenic derivative peptides and at least 1 region of an amyloid beta peptide or their immunogenic fragments, protein conjugates, immunogenic derivative peptides and immunogenic peptidemimetics. Examples include all-D peptides and immunogenic peptidemimetics. Examples include all-D peptides and immunogenic peptides and associated cellular toxicity. The amyloid of the amyloid-beta peptide and the all-D derivative peptides given in AABB3623-64. The vaccine ellicits a preferential TH-2 or TH-1 response, preventing fibrillogenesis and associated cellular toxicity. The amyloid of in ABB3623-64. The vaccine ellicits a preferential TH-2 or TH-1 response, or elated diseases may be localised amyloidosis, e.g. diabetes type II, neurodegenerative diseases, e.g. bowine spongiform encephalitis, created diseases, e.g. bowine spongiform encephalitis, created diseases, e.g. tuberroulosis) or chronic infection (e.g. tuberroulosis) or chronic infection (e.g. tuberroulosis) or chronic infection (e.g. tuberroulosis) or chronic infection (e.g. tuberroulosis) or chronic infection (e.g. tuberroulosis) or chronic infection (e.g. tuberroulosis) or chronic infection (e.g. tuberroulosis) or chronic infection arbitial mediate arepetide and encephalists.

The invention relates to an amyloid-targeting imaging agent comprising an amyloid targeting moiety, a linker moiety and a labelling moiety. The capant is of general formula A.L.(A.l.n.k) z.A.l.a.b. [1] where z = 0 - 1; A.L. a labelling moiety; A.L. a linker moiety; and A.L. a.b. a tabelling moiety. Also included are imaging amyloid deposition or diagnosing an amyloid-related condition in a patient involving administering (1) to the patient, and ultrasound imaging (1) in the patient to determine the presence of amyloid or amyloid-related condition or a reducing agent, a buffering agent, a transchelating agent, and cinturctions for the preparation and use of the radiopharmaceutical in the imaging of amyloid or an amyloid-related condition. The agents are used for imaging anyloid deposition and for diagnosing an amyloid related condition or a crebral amyloid deposition and for diagnosing an amyloid related condition or a crebral amyloidoses (transmissible virus dementias), familial CJD, crephalopathy (BSB), inflammation-associated amyloido, type II diabetes, primary amyloidosis, feline spongiform encephalopathy, non-transmissible crephalopathy (BSB), inflammation-associated amyloidosis, cerebral amyloidosis, Alzheimer's disease, prion-mediated diseases, dialysis-related amyloidosis, light chain-related amyloidosis, cerebral amyloidosis, light chain-related amyloidosis, cerebral amyloidosis, light chain-related amyloidosis, carebral amyloidosis, present sequence is a peptide forming the amyloid targeting moiety of the ansart of the invention
  New amyloid-targeting imaging agents useful for in vivo imaging amyloid plaques and/or for the treatment of amyloidosis disorders.

  The invention relates to an amyloid-targeting imaging agent comprising an amyloid targeting moiety, a linker moiety and a labelling moiety. The amyloid targeting moiety, a linker moiety and a labelling moiety. The cagent is of general formula A.t.(A.l.n.k) z-A.l.a.b (1) where z = 0 - 1;

A.t. = an amyloid targeting moiety. Also included are Imaging amyloid deposition or diagnoshing an amyloid-related condition in a patient involving administering (1) to the patient, and ultrasound imaging (1) in the patient to determine the presence of amyloid or amyloid-related condition or the imaging agent, a buffering agent, a transchelating agent, and instructions for the preparation and use of the radiopharmaceutical in the imaging of amyloid or an amyloid-related condition. The agents are used for imaging amyloid deposition and for diagnoshing an amyloid deposition and for diagnoshing an amyloid deposition or condition e.g. Creutzfeldt-Jakob disease (CUD), kuru, transmissible cerebral amyloidoses (transmissible virus dementias), familial CUD, cerebral amyloidosis, inflammation-associated amyloid, type II diabetes, primary amyloidosis, feline spongiform encephalopathy, non-transmissible cerebral amyloidosis, light chain-related amyloidosis, cerebral condition e.g. dialysis-related amyloidosis, light chain-related amyloidosis, light chain-related amyloidosis, cerebral amyloidosis, light chain-related amyloidosis, cerebral amyloidosis, light chain-related amyloidosis, premient amyloid angiopathy. The agents are capable of toossing the blood-brain conservation and are capable of priming specifically to amyloid angiopathy.

amyloid angiopathy. The new method of the invention involves contacting a blood vessel wall cell with an amyloid-beta40 inhibitor. The invention can be used for treating disease states characterised by cerebral angiopathy, particularly Alzheimer's disease, hereditary cerebral heemorrhage with amyloidosis of the Dutch type and haemorrhagic stroke. The present sequence represents one of a group of peptides (AAU11648-AAU11669, AAU11911) that were used in the invention as a carrier for the amyloid-beta40 (Abeta40) inhibitor. The Abeta40 inhibitor was used in the invention to treat a disease state characterised by cerebral amyloid angiopathy (CAA)
  Inhibiting cerebral amyloid angiopathy used for treating e.g. Alzheimer's disease comprises contacting blood vessel wall cell with amyloid-beta 40

  The invention relates to a method for prevention and/or treatment of an amyloid-related disease which comprises administration of an all-D - amyloid-bett apptide. The method is used for preventing and/or treating Alzheimer's and other amyloid related disease e.g. cerebral amyloid angiopathy; for altering serum levels of amyloid-beta in a mammal and favours the clearance of soluble amyloid-beta or fibril amyloid-beta from the mammal; and reducing or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid diseases including the mammal; and reducing or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid diseases including arthritis, juvenile chronic arthritis, ankylosing spondylitis, psoriatis, psoriatic arthropathy. Reiter's syndrome, Adult Still's disease, Bechet's syndrome and Crohn's disease. AA deposits are also produced as a result of chronic microbial infections (preferably leprosy, tuberculosis, bronchiectasis, decubitus ulcers, chronic pyelonephritis, osteomyelitis and Whipple's disease). Certain malignant neoplasms can also result in AA fibril amyloid deposits including Hodgkin's lymphoma, renal carcinoma and hairy cell leukaemia. The process of present sequence is an Abeta peptide used to illustrate the method of the invention.

The invention relates to an amyloid-targeting imaging agent. The imaging agent comprises an amyloid targeting moiety (such as a peptide) joined to a labeling moiety via a linking moiety, and is preferably able to cross the blood-brain barrier. The invention also relates to a kit for preparing a radiopharmaceutical preparation from the imaging agent of the invention, a method for imaging amyloid espoation in a patient and a method for imaging amyloid-related condition in a patient. The amyloid-targeting imaging agent is useful in imaging to diagnose amyloid-targeting imaging agent is useful in imaging to diagnose amyloid-transmissible cerebral amyloidoses (also known as transmissible virus channed conditions such as creative dementias), familial CUD, scrapie, transmissible mink encephalopathy (CC bovine spongiform encephalopathy (BSE), inflammation-associated amyloid, type II diabetes, primary amyloidosis, feline spongiform encephalopathy, contransmissible cerebral amyloidosis (e.g. Alzheimer's disease), prion-transmissible cerebral amyloidosis (e.g. Alzheimer's disease), prion-amyloidosis, cerebral amyloidosis, the can alsease in a anyloidosis, cerebral amyloid angiopathy or Alzheimer's disease in a myloidosis, cerebral amyloid angiopathy or Alzheimer's disease in a patient. The agent does not exhibit excessive toxicity or irritetion, does not induce an allergic response, and permits an earlier diagnosis of
   ö
amyloid-related conditions, thereby allowing earlier treatment and hence prevention of the undesirable effects of such disorders. Sequences ADY37921-ADY37947 and ADY37949 represent peptides which may be used as the amyloid-targeting moiety in an imaging agent of the invention.
   New amyloid-targeting imaging agent, useful for diagnosing an amyloid-related condition, e.g. Creutzfeld-Jakob disease, bovine spongiform encephalopathy, primary amyloidosis or Alzheimer's disease.

  The present sequence is the calmodulin (CaM)-binding region of rat inducible nitric oxide synthase (iNOS). iNOS is one of three isoforms of the enzyme NOS, which synthesises nitric oxide from the amino acid Larginine. The sequence is provided for comparison with endothelial nitric oxide synthase (eNOS). The threonine residue at position 495 of eNOS is phosphorylated by AMP-activated protein kinase (AMPK) in the absence of Ca2+-CaM. Phosphorylation results in inhibition of eNOS. In the presence of Ca2+-CaM, phosphorylation by AMPK occurs predominantly at Ser-1177 and treatment of ischaemic heart disease by promoting glucose and fatty acid metabolism, and improving nutrient and oxygen supply to the myocytes. They may also be used for the treatment of pulmonary hypertension and
amyloid-related conditions, thereby allowing earlier treatment and hence prevention of the undeshrable effects of such disorders. Sequences ADY37921-ADY37947 and ADY37992 represent peptides which may be used as the amyloid-targeting moiety in an imaging agent of the invention.

   The present sequence represents the calmodulin-binding site of rat iMOS coxide synthase (eNOS) mutants having one or more mutations in an animo acid sequence corresponding to a functional domain of a mammalian eNOS.

At least one of the mutations is at a position corresponding to an amino acid sequence corresponding to a functional domain that is phosphorylated in mammalian cells, and not an amino acid substitution to Ala or Asp. Also card residue in a calmodulin-binding domain that is phosphorylated in mammalian cells, and not an amino acid substitution to Ala or Asp. Also described: (1) an isolated eNOS polypeptide mutant that is substantially consolidated in the polypeptide mutant; (2) an isolated polymucleotide correction comprising the polypeptide mutant; (3) a recombinant vector comprising the polymucleotide; (5) a binding partner of the polypeptide mutant; (6) modulating eNOS activity in a cell by administering to the cell, administering the polypeptide mutant or the polymucleotide; (5) a binding partner of the polymetide to the cell, administering the polypeptide mutant or the polymucleotide to the cell, catchity in a cell by administering a condition and (9) prophylactic and certivity indicative of treating a condition, and (9) prophylactic and activity by administering a condition, and (9) prophylactic and certivity by administering a condition and anoscelic cativity by administering a condition associated with aberrant eNOS activity, antilipaemic and anoscelic cativity by administering a condition associated with aberrant eNOS activity, antilipaemic and anoscelic cativity by administering a condition associated with aberrant eNOS activity, antilipaemic and anoscelic cativity by administering the polypeptide mutant or polymucleotide to the palypeptide mutant, polymucleotide and mathods are useful for cativities, and has reduced calcium dependence and increased activity.

The polypeptide mutant, polymucleotide and methods are useful for cativity, and anoscelectic and increased activity.

recombinant methods such as PCR amplification (see AAV12502) of chwMP-2 coding sequence (see AAV03995) and cloning into e.g. pGEX-3X vector for expression in E. coli as a fueion protein with glutathione-S-transferase. The invention relates to the discovery that angiogenesis is mediated by the specific vitronectin receptor alpha-v beta-3, and that inhibition of alpha-v beta-3 function inhibits angiogenesis. Claimed antagonists of alpha-v beta-3 comprise C-terminal fragments (see AAW41083-94) of human or chicken MMP-2, fusion polypeptides, cyclic or linear polypeptides (see also AAW41099-110), derivatised polypeptides, a monoclonal antibody or organic mimetic compound. The antagonists are used to inhibit angiogenesis in: inflammed tissue for treatment of arthritis or rhound arthritis, solid tumours or metastases, particularly to induce theumatoid arthritis; solid tumours or metastases, particularly to induce cumour regression or inhibit growth of tumours; and in ocular disorders such as diabetic retinopathy or macular degeneration (all claimed). They can also be used to treat restenosis caused by migration of smooth muscle cells following angioplasty and to reduce blood supply to selected tissues (claimed). The new antagonists such blanks selective for rangiogenesis. Only new blood vessels express alpha-v beta-3, so mature wessels are unaffected, and the antagonists should be of low toxicity

  The invention relates to a method of inhibiting angiogenesis in a tissue by the administration of a composition comprising an organic by the administration of a composition comprising an organic peptidonimetic antagonist of integrin alpha-V beta-3 (vitronectin receptor). The integrin alpha-V beta-3 antagonist and compositions containing it are useful for inhibiting angiogenesis in a variety of medical conditions. The antagonist may be used to induce the regression of solid tumours or solid tumour metastases, to inhibit the growth of solid tumours undergoing neovascularisation; to treat inflamed tissue in which neovascularisation is occurring (e.g., in rheumatoid arthritis); to treat neovascularisation in retinal tissue (e.g., in diabetic retinopathy); to treat restenosis in a tissue by inhibiting smooth muscle coll migration (such as that which occurs following angioplasty); and to reduce the blood supply to a tissue required to support new growth of the tissue. Sequences ADT05998-ADT06001 represent C-terminal (hemopexin domain) fragments of chicken matrix metalloprocease 2 (MMP-2, gelatinase) containing the amino acid substitutions Y517C and/or W551C which are components of glutathione-S-transferase (GST)/MMP-2 fusion proteins used in an example of the invention. Note: The present sequence is not shown in the specification, but was derived from the wild-type officken MMP-2 C terminal fragment ADT05971 and the information given on page 49.

alpha-v beta-3 function inhibits angiogenesis. Claimed antagonists of alpha-v beta-3 comprise C-terminal fragments (see AAM41083-94) of human or chicken MMP-2, fusion polypeptides, cyclic or linear polypeptides (see also AAM41098-110), derivatised polypeptides, a monoclonal antibody or organic mimetic compound. The antagonists are used to inhibit angiogenesis in: inflammed tissue for treatment of arthritis or rheumatoid arthritis; solid tumours or metastases, particularly to induce tumour regression or inhibit growth of tumours; and in coular disorders such as diabetic retinopathy or macular degeneration (all claimed). They can also be used to treat restenosis caused by migration of smooth muscle cells following angioplasty and to reduce blood supply to selected tissues (claimed). The new antagonists are highly selective for angiogenesis. Only new blood vessels express alpha-v beta-3, so mature vessels are unaffected, and the antagonists should be of low toxicity
   Peptides AAW41228-33 are derived from the mature protein of human matrix metalloprotease-2 (WMP-2) (AAW41226). The present peptide is derived from amino acids 439-546. The peptides are able to act as alpha-v-beta-5 antagonists. Alpha-v-beta-5 as vitronectin receptor. Inhibitors of alpha-v-beta-5 can inhibit angiogenesis. The specification describes a novel labelled package that contains an inhibitor of angiogenesis i.e. an alpha-v-beta-5 antagonising polypeptide that binds to integrin alpha-v-beta-5 and includes a part of the C-terminal domain of WMP-2. The antagonists are used to inhibit anglogenesis in inflamed tissue, in solid

   Peptides AAW41234-39 are derived from the chicken matrix metalloprotease-2 (WMP-2) protein (AAW41227). The present peptide is derived from amino acids 516-637. The peptides are able to act as alpha-v-beta-5 antagonists. Alpha-v-beta-5 is a vitronectin receptor. Inhibitors of alpha-v-beta-5 can inhibit angiogenesis. The specification describes a novel labelled package that contains an inhibitor of angiogenesis i.e. an alpha-v-beta-5 antagonising polypeptide that binds to integrin alpha-v-beta-5 and includes a part of the C-terminal domain of MMP-2. The antagonists are used to inhibit angiogenesis in inflamed tissue, in solid

inflammation, eye diseases etc.

This polypeptide comprises amino acid residues 445-637 of chicken mature matrix metalloproteinase 2 (chWMP-2, see AAW41111). It can be produced by recombinant methods such as PCR amplification (see AAV12502) of chWMP-2 coding sequence (see AAV0395) and cloning into e.g. pGEX-3X vector for expression in E. coli as a fusion protein with glutathione-S-transferase. The invention relates to the discovery that angiogenesis is mediated by the specific vitronectin receptor alpha-V beta-3, and that inhibition of alpha-V beta-3 function inhibits angiogenesis. Claimed antegonies of alpha-V beta-3 comprise C-terminal fragments (see AAW41083-94) of human or chicken MMP-2, fusion polypeptides, can amplicate and antibody or chicken MMP-2, fusion polypeptides, a monoclonal antibody or organic mimetic compound. The antagonies are used to inhibit or angiogenesis in infilammed tissue for treatment of arthritis or chaumatoid arthritis, solid tumours or metastases, particularly to induce tumour regression or inhibit growth of tumours; and in ocular disorders

```
This polypeptide comprises amino acid residues 439-631 of human mature matrix metalloproteinase 2 (huMMP-2). It can be produced by recombinant methods such as PCR amplification (see AAV12510) of huMMP-2 ocding equence and cloning into e.g. pGRX-3X vector for expression in E. coli as a glutathione-S-transferase fusion protein. The invention relates to the discovery that ampiogenesis is mediated by the specific vitronectin receptor alpha-v beta-3, and that inhibition of alpha-v beta-3 function inhibits angiogenesis. Claimed antagonists of alpha-v beta-3 comprise C terminal fragments (see AAW41081-94) of human or chicken MMP-2, fusion polypeptides, cyclic or linear polypeptides (see also AAW4108-110), derivatised polypeptides, a monoclonal antibody or organic mimetic compound. The antagonists are used to inhibit angiogenesis in: inflammed tissue for treatment of arthritis or rheumatoid arthritis, solid tumours or metastases, particularly to induce tumour regression or inhibit growth actual degeneration (all claimed). They can also be used to treat accular degeneration of smooth muscle cells following

Packaging material containing polypeptide antagonist of alphav, beta5 integrin - used for inhibition of angiogenesis, and for treating tumours, inflammation, eye diseases etc.

Claim 2; Page; 117pp; English.

Peptides AAW41228-33 are derived from the mature protein of human matrix metalloprotease-2 (MMP-2) (AAW41226). The present peptide is derived from amino acids 410-631. The peptides are able to act as alpha-v-beta-5 antagonists. Alpha-v-beta-5 is a vitronectin receptor. Inhibitors of alpha-v-beta-5 can inhibit angiogenesis. The specification describes a novel labelled package that contains an inhibitor of angiogenesis i.e. an alpha-v-beta-5 antagonising polypeptide that binds to integrin alpha-v-beta-5 and includes a part of the C-terminal domain of MMP-2. The antagonists are used to inhibit angiogenesis in inflamed tissue, in solid tumours or metastases, and in a wide range of coular disorders (e.g. diabetic or other forms of retinopathy, neovascular glaucoma, or corneal transplants). They are particularly used to induce regression or to inhibit growth of tumours. The alpha-v-beta-5 and solve inhibit growth of tumours. The alpha-v-beta-5 and solve inhibit growth of tumours. used to treat restenosis caused by migration of smooth muscle cells following angioplasty and to reduce blood supply to selected tissues. The antagonists particularly inhibit neovascularisation where this is induced by cytokines, e.g. transforming growth factor alpha, epidermal growth factor or especially vacular endothelial growth factor. note: this sequence does not appear in the specification; it was created using information provided

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primeras, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at (II). The sequences in the printed specification, but was obtained in the printed specification.

The original source of the protein material was H-ras transformed human bromchial epithelial cells (TBE-1). The AA sequence was then used to develop oligonucleotide probes which were used to screen a CDNA library of human skin fibroblast mRNA. The longest clone, pGEL 186.2, represented almost the full gelatinase mRNA sequence except the leader sequence encoding the first few AA's of the signal peptide. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct PA field.)

type in processing sequence was determined feee also Hophtya, M. et al., COMPlete amino acid sequence was determined feee also Hophtya, M. et al., CC (1988) FEBS Letters 233, 109-113). Based on this sequence, peptides were synthesised feee features) having homology with a histidine conneg domain at residues 371-386, a cysteine contrg. domain at residues 200-370, the 80 cerdinus. These respinals or a region 159 residues from the carboxy cerminus or a region 159 residues from the carboxy cerminus. These respinals correspond to the domain of the enzyme involved in enzyme activation and interaction of the enzyme with the substrate. They can be used in the treatment of inappropriate anglogenesis, arthritis, tumour growth, invasion and metastasis and granulomatous inflammatory conditions such as sarciodisis. The peptides can be used to produce antibodies. Peptide 6, at concn. of 0.1 mW inhibited 80% of the canyme activity. See also US7494796-A and W09010228.   DNA encoding human type IV collagenase (gelatinase) - for use in the treatment of hypertrophic scars, keloids and intervertebral disc disease.
  Human type IV collagenase (gelatinase). Protein source was H-ras determined human bronchial epithelial cells (TBE-1). The sequence was determined from clone pdel 186.2 which represents almost the full mRNA sequence. Peature 1 is the N-terminal domain, I; feature 2 is a middle domain, II, which is organised into 3 x 58 amino acid long head to tail repeats (features 4,5,and 6). These show homology to the type II motif collagen binding domain of fibxonectin. Feature 3 is the C-terminal domain. The enzyme could be used in the treatment of hypertrophic scars, keloids, and intervertebral disc disease. See also AAN91700. (Updated on 25-MAR-2003 to correct PP field.) The present sequence represents the mature protein of human matrix metalloprotease-2 (MMP-2). Fragments of this protein (AAM41228-33) are able to act as alpha-v-beta-5 can inhibit a vitromettin receptor. Inhibitors of alpha-v-beta-5 can inhibit an inhibitor. Inhibitors of alpha-v-beta-5 can inhibit an inhibitor of angiogenesis. The specification describes a novel labelled package that angiogenesis. The specification describes a novel labelled package that contains an inhibitor of angiogenesis. i.e. an alpha-v-beta-5 antagonising polypeptide that binds to integrin alpha-v-beta-5 antagonising colypeptide that binds to integrin alpha-v-beta-5 antagonising of the c-terminal domain of MMP. The antagonists are used to inhibit of the contained tissue, in solid tumours or metastases, and in a mid-genesis in inflamed tissue, in solid tumours or metastases, and in a cretinopathy, neovascular glaucoma, or conneal transplants). They are particularly used to induce regression or to inhibit growth of tumours. The alpha-v-beta-5 antagonists can also be used to treat restencisis caused by migration of smooth muscle cells following angioplasty and to reduce blood supply to selected tissues. The antagonists particularly inhibit neovascularisation where this is induced by cytokines, e.g. transforming growth factor alpha, epidermal growth factor alpha, epidermal growth factor alpha, epidermal growth factor alpha, epidermal growth factor alpha, epidermal growth factor alpha, epidermal growth factor alpha, epidermal growth factor alpha, epidermal growth factor alpha, epidermal growth factor alpha, epidermal growth factor alpha, epidermal growth factor alpha.
   Packaging material containing polypeptide antagonist of alphav, betas integrin - used for inhibition of angiogenesis, and for treating tumours, inflammation, eye diseases etc.

   The present invention relates to novel synthetic oligopeptides effective in blocking cancer invasion and metastasis. The invention relates to matrix metalloproteinase-2 (MMP-2) peptides. The synthetic oligopeptides are useful as pharmaceutical compositions for blocking or treating cancer invasion and metastases in a human patient. In particular, they are useful for treating brain cancer, lung cancer, skin cancer or breast cancer. The oligopeptides are also useful as vaccines for preventing these cancers, enhancing immune response or raising antibodies for assays used to diagnose diseases involving matrix metalloproteinases or clinical monitoring of the progression or regression of disease. They are also
   New synthetic oligopeptide, useful for blocking or treating cancer invasion and metastases in a human patient, particularly as a vaccine for treating or preventing diagnosing brain cancer, lung cancer, skin cancer
  useful in gene therapy. The present sequence is the human MMP-2 protein.

The present sequence is that of human matrix metalloproteinase-2 (MWP-2), previously known as 72 kDa gelatinase and gelatinase A. MMP-2 is capable of degrading the extracellular matrix components of the basement membrane. The invention relates to methods for treating pain in a patient by administering a dual inhibitor of MMP-2 and MMP-9 (see AAB20491). The administration of an inhibitor of MMP-2 is useful for treating nerve tissue damage (claimed), where the patient is suffering from a disease or disorder selected from stroke, haemorrhage, reperfusion injury, cerebral ischaemia and cerebral infarction (claimed). The method is useful for treating a disease, disorder or nerve tissue damage selected from enhanced or exaggerated sensitivity to acute pain, burn pain, atypical facial pain, neuropathic pain, back pain, complex regional pain syndrome infection, post-herpetic neuralgia, phancom limb pain, labour pain, cancer pain, post-chemotherapy pain, post-operative pain, post-stroke pain, post-chemotherapy pain, post-operative pain, post-stroke pain, post-chemotherapy pain, post-operative pain, post-stroke pain, post-chemotherapy pain, post-operative pain, post-stroke conditions/visceral pain, entralgia, painful diabetic retinopathy, trammatic nerve injury, and tolerance to narcotics or withdrawal from narcotics (claimed). MMP-2 polypeptides can also be used to screen for agonist or antagonist (inhibitor) compounds

   The present sequence is human matrix metalloproteinase (WMP)-2 protein used in the exemplification of the invention. MMP-25 DNA is located on chromosome 11q22. Matrix metalloproteinases are a family of zinc dependent endopeptidases that function extracellularly to degrade proteins typically found in the extracellular matrix. MMP-25 is expressed in skin cells of mammals, particularly in breast cells and hair follicles. MMP-25 DNA is useful for identifying a nucleic acid molecule encoding all or part of MMP hybridising MMP-25 to a nucleic acid sample and identifying a sequence that hybridises in the nucleic acid sample. The identifying the hybridising performing polymerase chain reaction (PCR) to amplify the hybridising sequence. MMP-25 antibody is useful for identifying type 25 MMP. WMP-25 protein inhibitors may be used to modulate hair growth and breast cancer in a mammal

The present invention describes an anti-angiogenic composition (I) for inhibiting expression of vascular endothelial growth factor (VEGF). (I) comprises an effective amount of a peptide inhibitor of matrix metalloproceinase (MMP), where the peptide an inhibit the expression of VEGF. (I) has cytostatic, vulnerary, cardiant, cerebroprotective, antidiabetic, ophthalmological and dermatological activities. (I) can be used for inhibiting expression of VEGF, and so can be used for inhibiting expression of VEGF, and so can be used for inhibiting expression of VEGF, and so can be used for inhibiting expression of VEGF.

Anti-anglogenic composition comprising peptide inhibitor of matrix metalloproteinase, useful for decreasing the expression of vascular endothelial growth factor and treating cancers and tissue injuries.

Example 1; Page 43-44; 103pp; English.

ö
   The invention comprises a crystalline form of a polypeptide corresponding to the catalytic domain of matrix metalloproteinase 9 (MMP9) protein - a gelatinase. The crystalline polypeptide of the invention is useful for treating a metalloproteinase mediated disease or condition in a warmblooded animal. The crystalline polypeptide is also useful for determining the three-dimensional structure of the MMP9 catalytic domain to high resolution. The three-dimensional structure of the MMP9 catalytic domain is useful for rational drug design, and the atomic coordinates of the catalytic domain of MMP9 are useful for selecting or designing the catalytic domain of MMP9 are useful for selecting or designing chemical modulacors (preferably inhibitors) of MMP9. The crystalline polypeptide of the invention is useful in the treatment of a metalloproteinase mediated disease or condition, such as: tumour growth; metastasis in cancer; arthritis; osteoarthritis; atherosclerosis;
metastatic, non-metastatic, vascularised, non-vascularised, hard or soft. (I) is also useful for treating injuries including wounds, surgical inclasions, chronic wounds, heart diseases and stroke. (I) is also useful for treating disorders characterised besselve angiogenesis e.g. macular degeneration and diabetic retinopathy. The present sequence represents the human MMP-2 protein, which is used in the exemplification

   The present invention relates to peptide inhibitors of metalloproteinases (MMPs), particularly metalloproteinase-2 (MMP-2). The inhibitors have epptide sequences related to the cleavage regions of the proenzyme forms of the MMPS. The peptide inhibitors are useful for stimulating cellular proliferation of fibroblasts or keratinocytes, promoting healthy skin development, treating wounds, preventing scarring, improving skin tone, reducing wrinkling and for simulating the development of smooth, healthy skin. The peptide inhibitors are useful as anti-aging and wound healing compounds. The present sequence represents human MMP-2
restenosis; periodontitis; multiple sclerosis; glomerulonephritis; graft-versus-host disease; and non-insulin dependent diabetes. The present amino acid sequence represents a human matrix metalloproteinase 2 (MMP2)
   Human; peptide inhibitor; matrix metalloproteinase-2; MMP-2; cleavage region; proenzyme form; cellular proliferation; fibroblast; keratinocyte; healthy skin development; wound healing; scarring; skin tone; wrinkle; anti-aging; vulnerary.
  Gaps
  Novel peptide inhibitor of proteinase activity of matrix metalloproteinases, e.g. matrix metalloproteinase-2, useful for stimulating cellular proliferation of fibroblasts or keratinocytes.

This invention relates to novel human genes and gene product which are implicated in certain disease states. Compounds which modulate the proteins of the invention may have cytostatic, antiinflammatory, compthalmological, antiarteriosclerotic or vulnerary activities. The sequences of the invention may be useful for gene therapy. The invention cay be useful for diagnosing or treating a hypoxia-regulated condition, cuch as tumourigenesis, angiogenesis, inflammation, crythropoiesis, or the biological response to hypoxia conditions catcholamine synthesis, it and transport or nitric oxide transportation, catcholamine synthesis, iron transport or nitric oxide transportation, catcholamine synthesis, iron transport or nitric oxide transportation, retinopathy, neonatal stress, pre-eclampsia, atherosclerosis, inflammatory conditions or wound healing. The present sequence is that of a disease related protein of the invention.

"Genome sequence of Haloarcula marismortui: a halophilic archaeon from
  Genome Res. 14:221-2234(2004).
-I- FUNCTION: Part of a binding-protein-dependent transport system.
Probably responsible for the translocation of the substrate across
   the membrane (By similarity).
--- SUBCELLULAR LOCATION: Integral membrane protein (By similarity).
--- SIMILARITY: Belongs to the binding-protein-dependent transport system permease family.

Total number of hits satisfying chosen parameters:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
